...porpoises swim in the water, traveling in schools. Sometimes these schools consist of a hundred porpoises. Warm air is drawn into the single breathing hole on the porpoise's head. This causes a hissing jet of steam when it is expelled into the colder outside air.

The common porpoise is about six feet

smooth whalelike body is black above and white below. It has a triangular dorsal fin in the middle of its back. This porpoise has twenty-five pairs of short, sharp-teeth each jaw. It eats salmon, mackerel, haddock, and crustaceans. Schools of porpoises often travel great distances in their search for food.
